This is the code: `import math def func1(f, a, b, c, d): res = ((a,b,c,d)-a)/c return res def func2(f, a, b, c, d, e, f, g, h, i, j): x = math.pi print(func1(math.tan, x, 1, 2, 3)) print(func2(math.tan, x, 1, 2, 3, 4))` This gives error. I want to create a generic function where I can pass any function in the parameters. Is this possible? A: You cannot pass a function as a parameter, since a function is an object and so is its associated name. You can pass a callable instead, and use it to call the function you want. To take the parameters and return them as a tuple you can do this: `def func(func, params): return tuple(func(*params))` You should be able to do that call like so: `print(func1(func2, (math.tan, x, 1, 2, 3, 4)))` Also be aware that you need parentheses around the parameter names in the function call. A call without the parentheses is treated as a function definition, and that's not what you want. Q: incompatible character encodings: ASCII-8BIT and UTF-8 I want to copy my code from Atom to Visual Studio (Windows). I use Sublime (Windows) and it seems that Atom use TextEdit (Mac OS). In Visual Studio I get the following error: 1 use: Edit: 82157476af
